# Agenda

- Problem Statement
- Enterprise Architecture Techniques
  - Scaffolding and Layers
- Example: Coal Ash Regulations
  - Context
  - Two Layer Scaffolding
  - Analysis
- Summary

# Problem Statement

- Laws and regulations are proposed to curb corporate excesses, ensure safety and privacy, and achieve other governmental goals

## **BUT HOW MUCH REGULATION IS TOO MUCH?**

- Most enterprises impacted by new/proposed laws and regulations immediately protest
  - New regulations force **CHANGE**
  - CHANGE impacts **CORPORATE CULTURE**– the underlying assumptions about the way things have “always” been done
  - CHANGE costs **MONEY**
- How can we effectively and logically assess the impact of new regulations on types of enterprises to determine if these regulations unnecessarily hamper the enterprise’s core business?

# Proposed Techniques

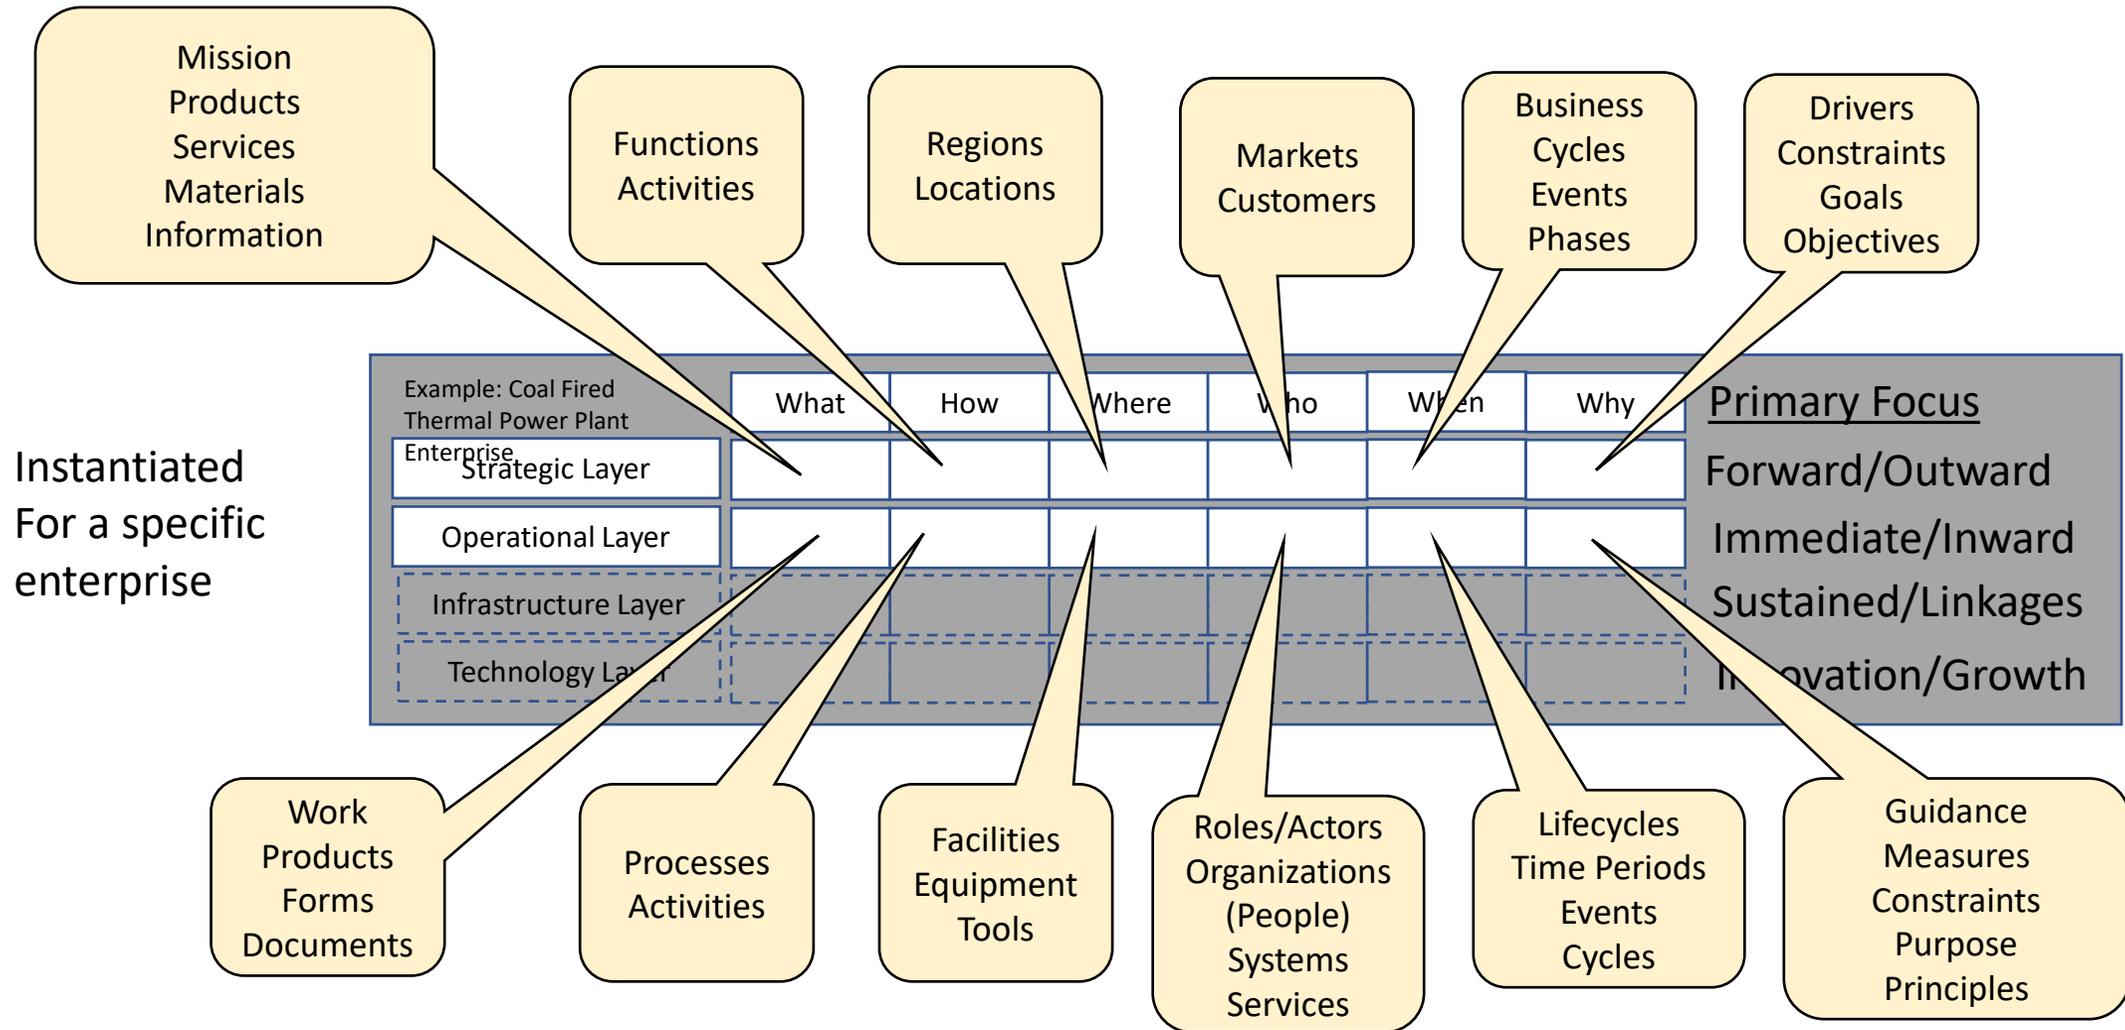

- Scaffolding
  - Closed Six-dimensional Analysis and Synthesis Framework
  - Systematic approach to data gathering
- Layers
  - Gathering data into a scaffolding for each needed aspect of the enterprise
  - Comparing data in each dimension across layers to see where impacts may fall
- Benefits
  - Problem Analysis/Synthesis – breaking down a complex problem into simpler sub-problems and synthesizing overall impacts, potential approaches, probabilities, and cost categorizations

(Techniques adapted from Enterprise Architecture)

# Scaffolding and Layer Definitions

- Scaffolding Dimensions
  - WHAT: Elements of constrained products, services, materials, information
  - HOW: Elements of constrained activities
  - WHERE: Elements of constrained locations, equipment, tools
  - WHO: Elements of constrained roles and responsibilities
  - WHEN: Elements of constrained time periods, events and cycles
  - WHY: Elements of purpose, rationale, drivers
- Layers
  - Strategic: CEO and Board viewpoint
  - Operational: Plant Operator Viewpoint
  - Data & Information: CIO Viewpoint
  - Technology: CTO viewpoint
  - Infrastructure: CTO and Facility Manager Perspective

# Scaffolding Illustration Sample

# Example: Coal Ash Regulations – Need

- Coal Ash is dirty, toxic stuff dangerous to both people and the environment
  - Contains: Arsenic, lead, mercury, and other heavy metals
- Coal ash a by-product of coal fired electric power plants
  - These plants exist in almost every state across the lower 48, usually sited near water sources
  - Coal ash is mixed with water and stored in impoundment ponds close by the power plant
- Recently (2008 to present) there have been multiple incidents of rivers, lakes, and other sources of drinking water being contaminated by leakage from coal ash ponds

# Coal Ash Regulations: Additional Context

- Focus on abstract Power Generation companies that operate coal fired power plants
- If these companies are owned in turn by holding companies that specialize in power related industries, this structure may limit the options of the power generation company to expand into other types of power generation
- The recent coal ash pollution incidents have resulted in federal regulations on coal ash storage (as well as multiple lawsuits)
  - Current administration looking at weakening these regulations

# Coal Ash Regulation Example Methodology

- Will limit this example to two layers: Strategic and Operational
- Scaffolding is developed for each layer for an abstracted coal fired power plant Public Utility company prior to regulations with impacts of regulations identified
- After scaffolding is developed, analysis is provided:
  - Taking impacts in each dimension across both layers,
  - Identifying potential approaches for the company in addressing the impacts
  - Estimating probability and cost rating for each approach
- After analysis, the set of the company's logical options can be identified and the overall impact of regulations on the company's core business evaluated

<b>STRATEGIC LAYER</b>	<b>POTENTIAL IMPACTS</b>	<b>PROBABILITY/COST ANALYSIS</b>
<b>WHAT: Electrical Power, Cost, Profit, Policy</b>	Changes in Cost, Profit, and Policy	Probability of Changes: High; Probability of Resistance: High Moderate to High Cost Increase Overall; Short Term Decrease in Profit; Moderate Cost of Policy Change
<b>HOW: Generate &amp; Distribute Power; Manage Costs; Maximize Profit</b>	Additional high-level business functions	Probability of New Business Functions: Moderate Moderate Cost
<b>WHERE: Plant Installations; Headquarters &amp; Business Offices</b>	Acquisition of additional land; modifications to existing installations	Probability of New Land Acquisition: Moderate; Probability of Modifications: High Moderate to High Costs
<b>WHO: Upper Management &amp; Executives; Planners; Business Units/Divisions</b>	New Business Units; new management responsibilities; new management skills/expertise	Probability: High Low to Moderate Costs
<b>WHEN: Business Lifecycle, Production Lifecycle, External Events</b>	Changes in business & production lifecycles; additional cycles & events	Probability: High Costs included in establishing new business functions
<b>WHY: Profits; Public Utility Services; Safety; Compliance</b>	New regulation compliance	Probability: High Costs include costs of overall changes

<b>OPERATIONAL LAYER</b>	<b>POTENTIAL IMPACTS</b>	<b>PROBABILITY/COST ANALYSIS</b>
<b>WHAT: Electrical Power, Coal, Water, By-products</b>	Restrictions on type of coal used; reduction in power output	Probability: Low High Costs
<b>HOW: Operate &amp; Maintain Coal-fired Power Plant; Manage Coal Supply/Storage; Manage By-product Storage; Maintain Grid Connections</b>	Move & line/seal ash ponds/pits; additional water pollution monitoring; transport of coal ash; recycling of coal ash	Probability: High High Costs; but potential new revenue stream
<b>WHERE: Power Plant Installation</b>	New locations for coal ash ponds/pits; transport roads; new monitoring sites	Probability: High High one-time costs
<b>WHO: Plant Managers; Operations/Maintenance Engineers &amp; Crews</b>	New/additional crews, engineers, and managers for coal ash transport and pond/pit sealing, maintenance, and monitoring	Probability: High Moderate to High Costs
<b>WHEN: Operations &amp; Maintenance Schedules; External Events</b>	New schedules for coal ash pond/pit development, maintenance, & monitoring; additional emergency responses	Probability: High Costs included in establishing new business functions
<b>WHY: Public Utility Requirements; Profit; Grid Cooperation Agreements; Safety; Compliance</b>	New safety concerns; new compliance concerns	Probability: High Costs include total costs of compliance plus additional safety costs for new business processes

# Summary

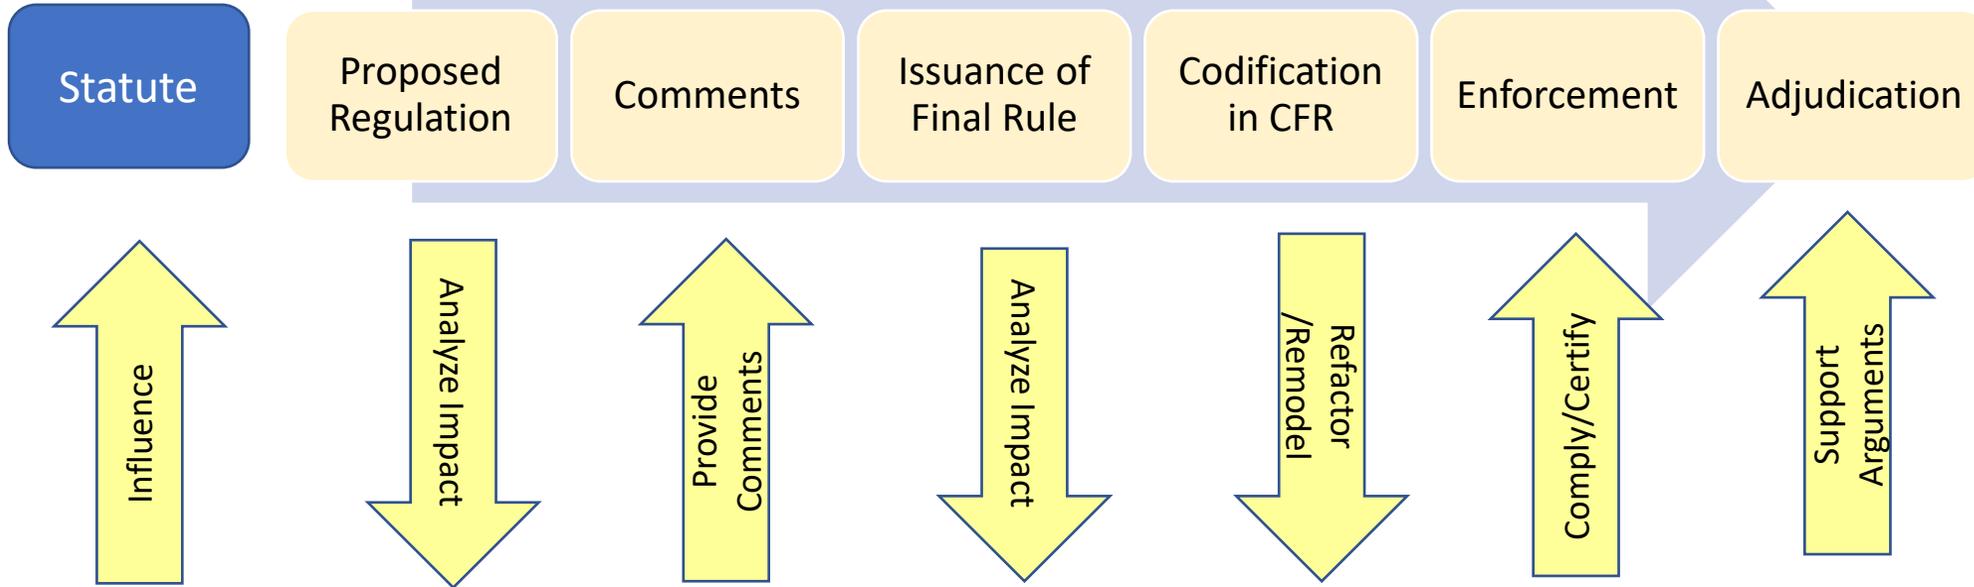

- Laws and regulations can impact an enterprise in multiple ways:
  - Requiring roles; requiring or constraining activities; constraining or requiring response/cycle times or other aspects of timeliness
- Enterprises tend to resist change and respond to proposed new laws and regulations with protest
- The impact of a law or regulation on an enterprise can be analyzed using a 6-dimensional scaffolding applied in layers that can then be “stacked” to see more overall impacts
  - Reasonable alternatives approaches to the impacts can be investigated
- This analysis can provide a cross check on how legitimate the protest against the new law is
- Once done, the analysis can be used to check the change in impacts caused by roll-back of parts of the regulations.

# Backup Slides

# Analysis of Impact Approach

Congress

Agency (Example EPA) Rulemaking Lifecycle

Scaffolding at each layer provides a systematic breakdown of architecture elements for pinpointed impact analysis

Example: Coal Fired Thermal Power Plant Enterprise	What	How	Where	Who	When	Why	Primary Focus
Strategic Layer							Forward/Outward
Operational Layer							Immediate/Inward
Infrastructure Layer							Sustained/Linkages
Technology Layer							Innovation/Growth

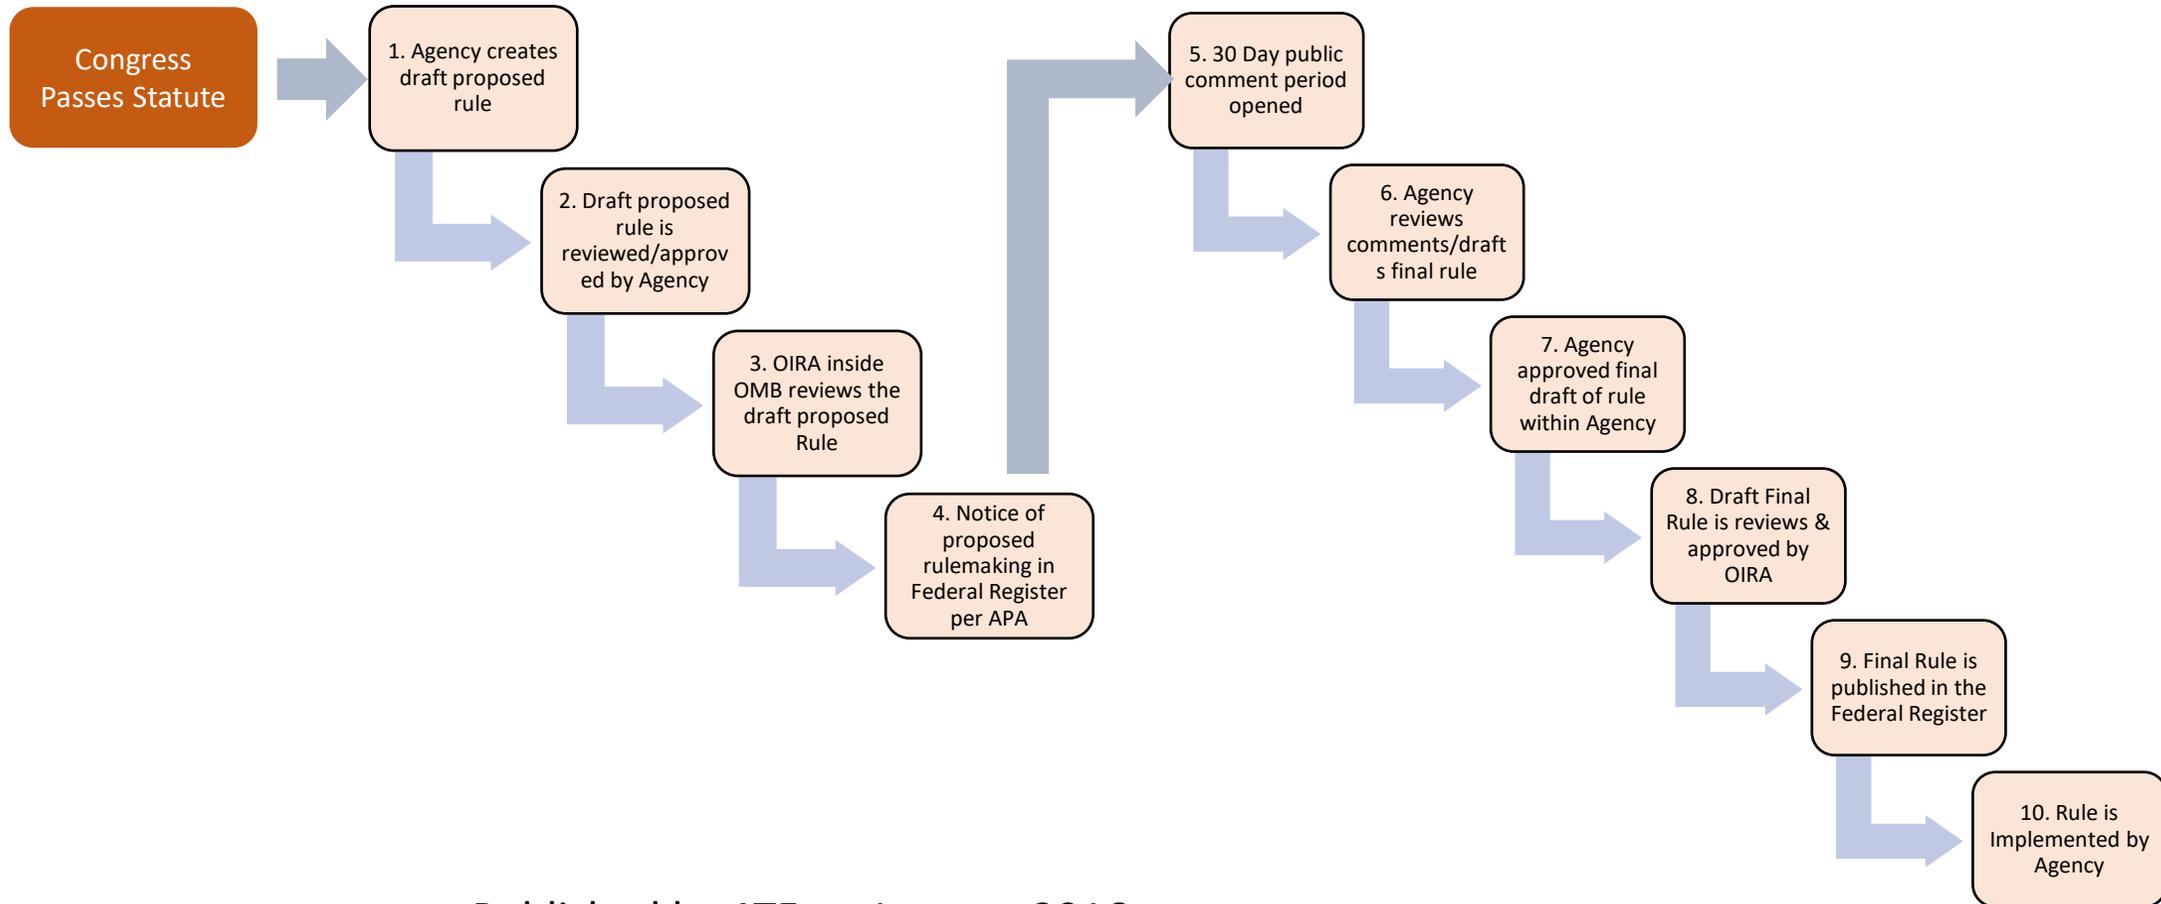

# Future Research

- Codifying scaffolding for specific domains
- Systematically deconstructing the elements of laws and regulations into the variables of architecture:
  - Information/Resource
  - Function/Activity (From the clauses)
  - Location
  - Role
  - Time
  - Motivation
- Representing Guidance narratives through a 1 layer scaffold just as we represent the enterprise with multiple layers and dimensions

# Summary

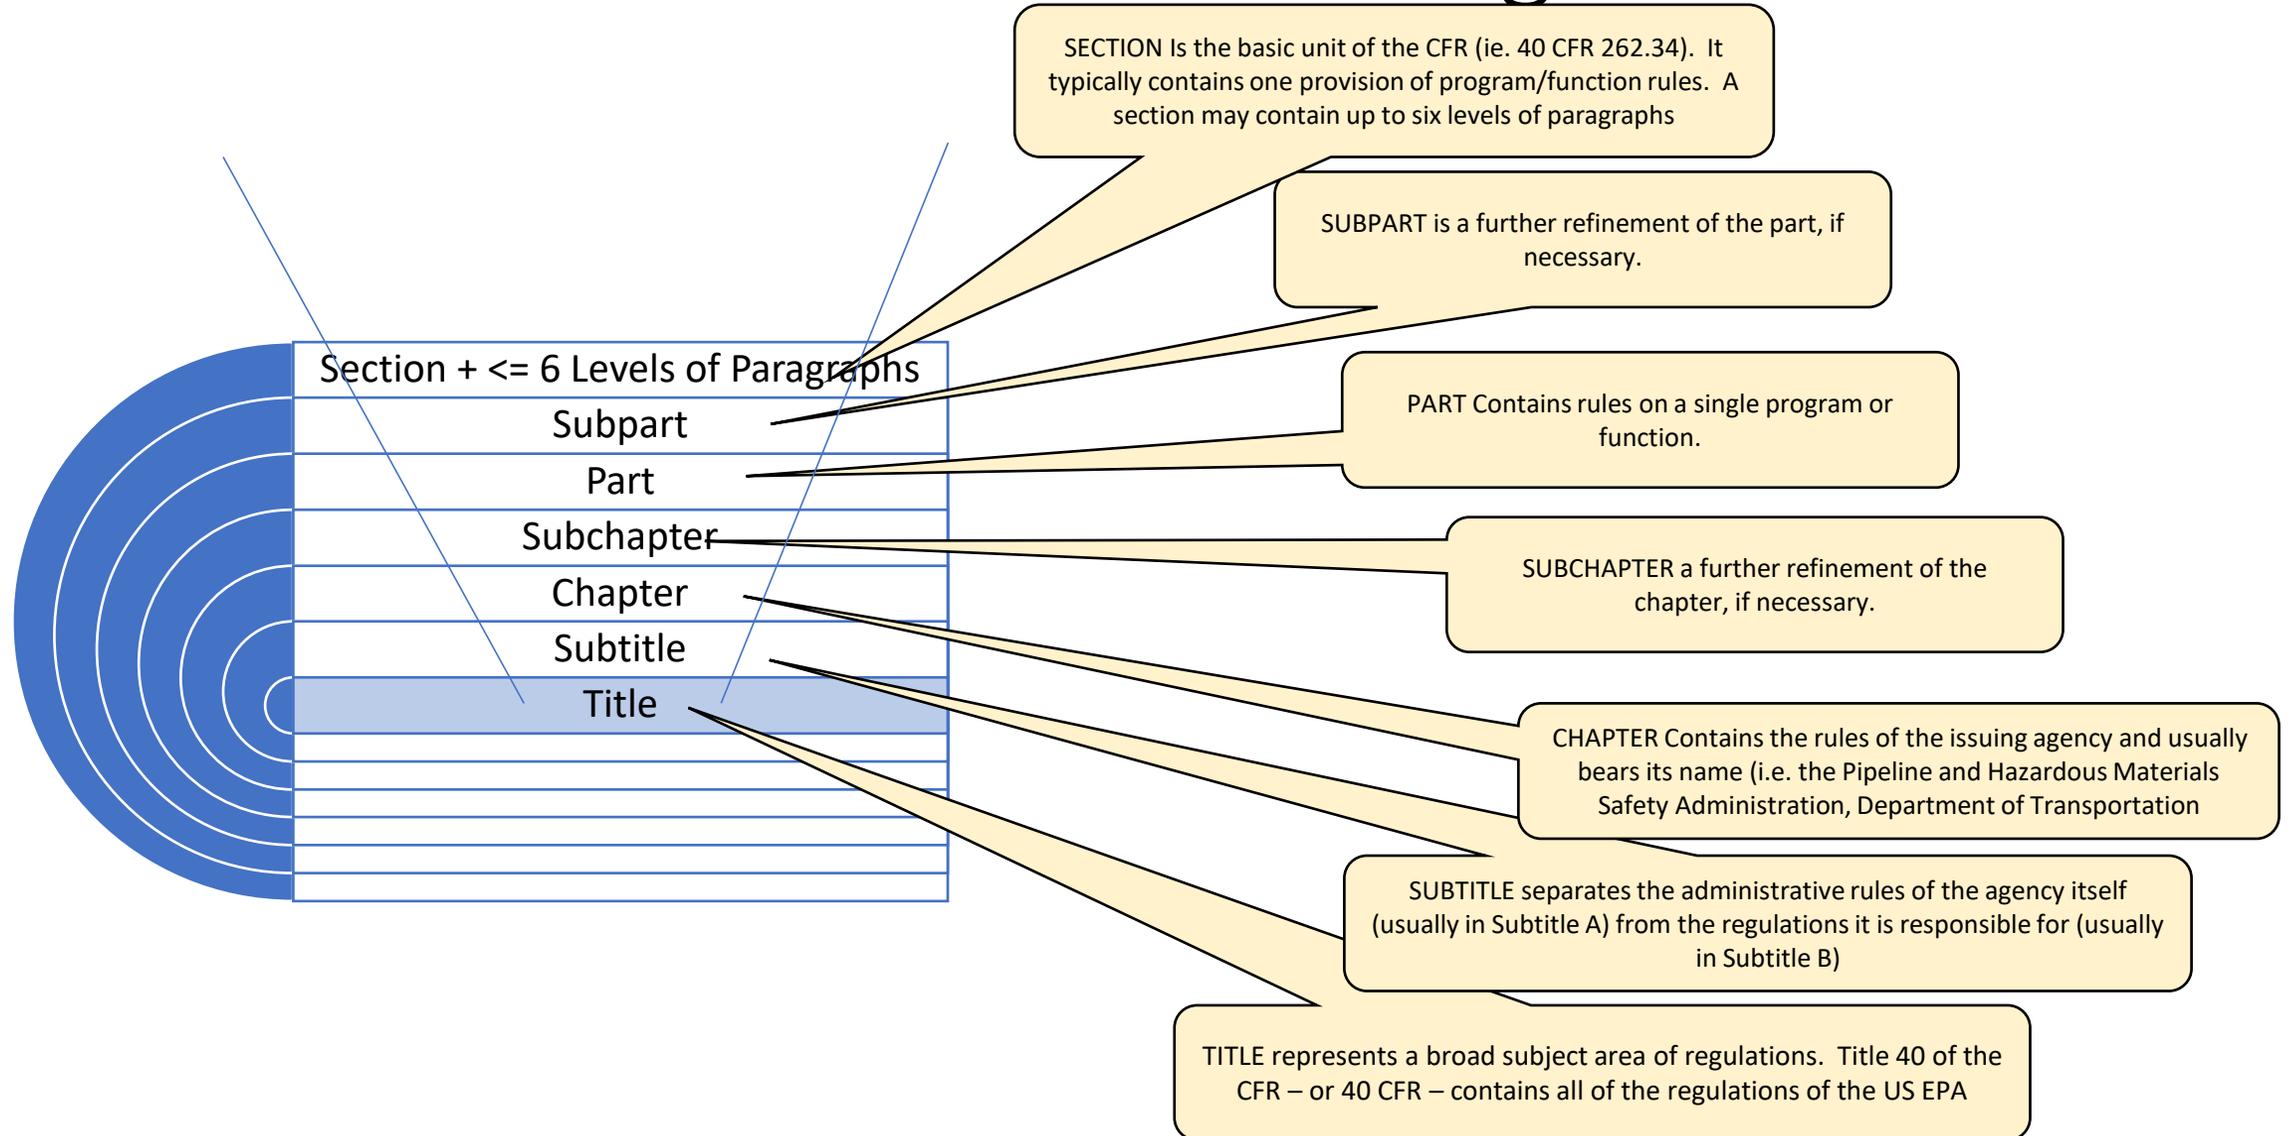

- Scaffolding techniques to represent enterprise architecture provide the following benefits
  - As-observed separation of concerns through the layers (No architecting distortion)
  - Separation of architecture variables through dimensions (Mutually exclusive variables)
  - Provision of a template for enterprise representation for each layer (Reduce architecting to a simpler exercise of instantiation)
- Laws and regulations are complex statements of constraints that involve/touch all enterprise variables and concerns (Layers and Dimensions)
- By separating variables and concerns, pinpointed analysis of impact can be easily performed by groups of stakeholders independently.
- The totality of impacts can be brought together to provide comments, feedback and redirection in rulemaking phases.

Understanding Rules through Rule Concept Mining

# Automated extraction of FARS Knowledge

The image is a screenshot of a web browser displaying a research paper. The browser's address bar shows the URL: <https://ebiquity.umbc.edu/paper/html/id/812/Automated-Knowledge-Extraction-from-the-Federal-Acquisition-Regulations-System-FARS->. The browser's bookmark bar includes items like 'Apps', 'Imported From IE', 'News', 'Popular', 'Wedding Planning', 'Bookmarks', 'New Zoning Rules to', 'YouTube to mp3 Con', 'Handyman', 'RESEARCH', and 'Other bookmarks'. The website's navigation menu includes 'UMBC ebiquity', 'About', 'Research', 'People', 'Publications', 'Tags', and 'Blog'. A search bar with 'Google Custi' and a magnifying glass icon is also present. The main content area features the title 'Automated Knowledge Extraction from the Federal Acquisition Regulations System (FARS)' in a large, bold, serif font. Below the title, the authors are listed as 'Srishty Saha, Karuna Pande Joshi, Renee Frank, Michael Aebig, and Jiayong Lin' in a smaller blue font. The date 'December 11, 2017' is centered below the authors. The abstract text begins with 'With increasing regulation of Big Data, it is becoming essential for organizations to ensure compliance with various data protection standards. The Federal Acquisition Regulations System (FARS) within the Code of Federal Regulations (CFR) includes facts and rules for individuals and organizations seeking to do business with the US Federal government. Parsing and gathering knowledge from such lengthy regulation documents is currently done manually and is time and human intensive. Hence, developing a cognitive assistant for automated analysis of such legal documents has become a necessity. We have developed semantically rich approach to automate the analysis of legal documents and have implemented a system to capture various facts and rules contributing towards building an efficient legal knowledge base that contains details of the relationships between various legal elements, semantically similar terminologies, deontic expressions and cross-referenced legal facts and rules. In this paper, we describe our framework along with the results of automating knowledge extraction from the FARS document (Title48, CFR). Our approach can be used by Big Data Users to automate knowledge extraction from Large Legal documents.'
